

Install docker : <https://www.docker.com>

1. Start docker
2. Get the kineticapp image

Go to the *images* tab and click on “Search images to run“

Enter : “*kineticapp*” and click on Pull button. It takes several minutes to download

When it is done, you should see this :

3. Start the application

Click on the small triangle in the right hand side.

A small window opens:

Click on the small arrow on the right hand side to see more settings. Add “5001” in the host port box. And click on “Run” button.

**Run a new container**
sophiets/kineticapp:latest

Optional settings ^

Container name

A random name is generated if you do not provide one.

Ports

Enter "0" to assign randomly generated host ports.

Host port

5001

:5001/tcp

Run

Go to the Containers tab, you should see a line, with the image “sophiets/kineticapp”. If so, this means that you successfully start the application.

Kinetic Analysis

This tool is made to estimate the kinetic parameters of translation (initiation rate and elongation rate).

You can find different tabs:

- Track generator: generate tracks to test parameters
- Track analysis simulation: analyse tracks from simulation
- Track analysis in vivo: analyse tracks from in vivo experiments

Generate tracks

Analyse tracks

Analyse one track - display

In this tab, you will be able to generate tracks according to a set of parameters. By default, tracks are make with a time step of 0.1sec.
You can see the fluorescence profile according to the parameters below.
When happy you can generate a csv file with all the tracks.

Protein length (aa) ⓘ
490

Suntag length (aa) ⓘ
796

Number of suntag ⓘ
32

Fluorescence one suntag ⓘ
4

Translation rate (aa/sec) ⓘ
24

Initiation rate (ribosome/sec) ⓘ
1

Retention time (sec) ⓘ
0

Suntag position (begin or end) ⓘ
Begin

Noise ⓘ
0

dt (sec) ⓘ
0,1

Length of one track (sec) ⓘ
6000

Number of tracks ⓘ
